Discussed the events leading up to **Child C** 'arrest'

- did not seem imminent
- active (kept pulling out n/a tubes)
- CRP + WSC suggested methox but was in
- not related to 0.5ml diluted antibiotics

Discussed resuscitation - technically performed well, team worked well together - causes of PEA considered + managed (aetio. not possible to exclude pulm. embolus or toxins at time of a resuscitation)

Post-mortem results not yet available (from coroner's case)

Following decision to stop active resuscitation after 25 mins (became no pulse or resp at non stage)

ventilation + gentle chest compression continued for another 50 mins simply to allow happy time for family (+ learn) at **Child C** bleed.

There was a delay in **Child C** bleed. **Child C** bleed. **Child C** bleed. **Child C** bleed.

Priest ended active resuscitation and parents wanted baptism in Catholic priest. By the end of the baptism **Child C** had

a pulse and intermittent gasping respirations. We agreed with parents that further life support measures were not being considered in parents.

Child C showed some signs of life for the next 5 hours whilst being watched by parents. Informed once active resuscitation stops.
