Subject: Badger query snd neonatal investigation

Hi Steve,

Is there any way to identify from badger a list of babies with prolonged hypoglycaemia during and just prior to the time we are concerned about?

I remember a baby with high glucose requirements that seemed to fluctuate. Astha and I did a load of hypoglycaemia bloods and the insulin level was high and the c peptide suggested it could be exogenous insulin. It didn't make sense as the baby had never been prescribed insulin and the hypoglycaemia was better by the time the results were back so I dismissed it, but it's been nagging at me recently.

If we could generate a list of patients from either badger or asking the lab for insulin levels done on neonates I will come in and look through the notes and try and find this patient.

Thanks

Doctor ZA
